<article> <blockquote class=messageText SelectQuoteContainer ugc baseHtml> <a href=http://searchengineland.com/meet-rankbrain-google-search-results-234386 target=\_blank class=externalLink rel=nofollow>http://searchengineland.com/meet-rankbrain-google-search-results-234386</a><br> <br> Google is implementing an AI known as RankBrain to interperate WHAT a searcher's query is REALLY looking for. Its only handling 15% of searches now, but it no longer displays results simply based on matching keywords. It tries to guess INTENT, and may deliver pages that completely ignore the keywords searched and instead deliver content on the topic of the search term. This also tells me that Google is gaining ground on the ability of reading content and getting an exact meaning of it without needing specific key phrases. So stuffing your iphone repair site with the term iphone repairs online in an attempt to gain rank in that term you may miss out while the searcher is delivered to a page that is about fixing broken 6s screens instead.<br> <br> This could be a step toward being able to judge, based on a search term, the INTENT of the searcher and therefore the likelihood of their being a conversion. This would allow Google to give the good traffic to more reputable sites while giving the unprofitable traffic to the other sites. This would continue Google's trend of uncoupling the importance of RANK and
